

Do you know which type of PCI DSS v4.0.1 certification is right for protecting your business?

Become PCI DSS certified, comply with the mandatory regulations and protect your customers' sensitive payment card data.

Who must be PCI DSS certified?

All organizations that accept, process, store or transmit credit card data must comply with the Payment Card Industry Data Security Standard (PCI DSS).

For organizations that process less than 20,000 transactions per year, PCI DSS level 4, we launched our new merchant portal that allows you to manage this certification process in a more agile, simple and secure way, complying with the highest standards of payment card data protection.

Why become PCI DSS certified through our portal?

The leakage or theft of sensitive data affects the entire payment card industry and all sectors are targeted by cybercrime. A cyber attack can have serious consequences for your organization.

The information being processed and stored is highly sensitive, so PCI DSS compliance, being mandatory, is a priority. An organization that does not comply with PCI DSS cannot fully guarantee the security of its customers' data and will be exposed to penalties, financial losses due to fraud, loss of the ability to operate with cards and even suffer serious damage to its reputation. PCI DSS compliance allows you to increase your customers' confidence by protecting their sensitive customer information.

Main benefits of the Merchant Certification Portal:

Full compliance with PCI DSS 4.0.1, ensuring data security.

Flexible process: start your certification and resume it at any time without losing the information already entered.

Intelligent chatbot that guides you and solves doubts throughout the process.

Detailed information on each step of the process, including a complete glossary.

New UI/UX, designed for an intuitive and optimized experience.

Control panel with status of the process and pending to be completed.

Complete flow on the same platform, avoiding process fragmentation.

Automatic creation and direct download of PDF certification documents upon completion of the certification process.

Dynamic form filling, avoiding manual data repetition.

Multilingual support, facilitating its use in different regions.

Automatic translation of user responses into English so that the final certification documents are aligned with the recommended international standards for PCI DSS.

SAQ A

The simplest option

- For merchants that do not process or store card data.
- All data handling is completely delegated to certified third party providers.

SAQ B

Ideal for very small stores and simple local operations

- For stores with stand-alone terminals without IP connection.
- Data is not stored and the device is completely autonomous.

SAQ C-VT

Requires advanced security measures to protect both equipment and environment

- It is intended for businesses that receive card data by phone, email or in person and manually enter it into a secure web portal provided by a payment platform.
- The device used must be completely isolated.
